

# Leafy Ambitions:

## A critical look at the use of canopy cover targets in urban forest governance

Cecil C. Konijnendijk

UFORIA – Urban Forestry Research In Action lab, University of British Columbia

# Outline

- Case studies of using canopy targets in urban forest governance – from Vancouver to Beijing
- Strengths of a canopy target approach
- Pitfalls of a canopy target approach
- Perspective

<https://i.pinimg.com/736x/63/4b/d1/634bd1c523696bbb96d141c312326b60-canopy-beds-dollhouse-furniture.jpg>

# TREE

## TREES KEEP US HEALTHY. FOLLOW THESE STEPS

### GET MOVING

Inspect trees and shrubs from the bottom up and look for specific problems such as brittle or dead branches, soft or decaying wood, small holes in trunk, or shallow pits in the bark and weak or off-color foliage.

Help your trees stay healthy by releasing fertilizers and nutrients and increasing their resistance to disease, insect stress, and environmental stress.

**Table 2**

Comparison of independent city estimates of percent urban tree canopy (UTC) cover to point based national sampling estimates.

City	Point Based UTC Estimate <sup>a</sup> (%)	Local Municipal Estimate UTC%	Year of Estimate
Vancouver	17.5	18.6	2010
Kelowna	12.2	13	2007
Calgary	9.3	7.1	2007
Edmonton	13.4	10.3	2007
City of Toronto	20.1	20.5	2007
Mississauga	16.1	15	2011
Brampton	8.9	11	2007
Oakville	22.8	29.1	2007
Ottawa	22.8	27	2007
Halifax	51.8	41	2007

<sup>a</sup> Regional estimate of UTC extracted from national point sampling estimate using municipal boundaries.

## Criteria and Indicators for Strategic Urban Forest Planning and Management

W. Andy Kenney, Philip J.E. van Wassenaeer, and Alexander L. Satel

---

**Abstract.** The success of urban forest management is frequently predicated upon achieving absolute canopy cover targets. This two-dimensional view of the urban forest does not provide a comprehensive assessment of urban forest stewardship in a community and does not account for an area's potential to support a forest canopy. A comprehensive set of performance-based criteria and indicators concerning the community's vegetation resource, community framework and resource management approach is described. This set of broadly based measures provides a more useful tool for the evaluation of urban forest management success and strategic management planning.

**Key Words.** Canopy Cover; Municipal Planning; Relative Canopy Cover; Sustainability; Urban Forest Planning; Urban Forestry.

---

*The succes of urban forest management is frequently predicted upon achieving absolute canopy cover targets. This **two-dimensional view** of the urban forest **does not provide a comprehensive assessment of urban forest forest stewardship** in a community and **does not account for an area's potential** to support a forest canopy.*

*Table 15.1* Ideal-typical governance arrangements according to Arnouts et al. (2012).

	<i>Hierarchical</i>	<i>Closed co-governance</i>	<i>Open co-governance</i>	<i>Self governance</i>
<i>Actors</i>	Mainly governmental actors	Select mixed group of actors	Large mixed group of actors	Mainly non-governmental actors
<i>Power</i>	With government	Pooled	Diffused	With non-government
<i>Rules</i>	Governmental coercion	Restricted cooperation	Flexible collaboration	Non-governmental forerunning

The reason for that is simple: research no longer supports a universal 40 percent tree canopy recommendation, and neither does American Forests.

**By Ian Leahy**, *American Forests*, Director of Urban Forest Programs

One of the most frequent questions I receive, as American Forests' Director of Urban Forest Programs, comes from individuals developing tree canopy goals for their jurisdiction or region. They have come across numerous references to American Forests' recommended 40 percent tree canopy goal but cannot find a source citation to include in planning documents.

The reason for that is simple: research no longer supports a universal 40 percent tree canopy recommendation, and neither does American Forests.

# Urban Forest Canopy Research – Common Themes

- **Canopy cover estimation**
- **Canopy and regulatory ecosystem services** (e.g. heat/climate, carbon, air pollution removal)
- **Canopy and environmental justice** – and relating canopy to e.g. household income

Also some work on:

- Health – e.g. general, asthma; education/school performance; crime; retail
- Governance and planning aspects (e.g. zoning), management/program criteria and indicators, public/private
- Tree planting programs, community efforts

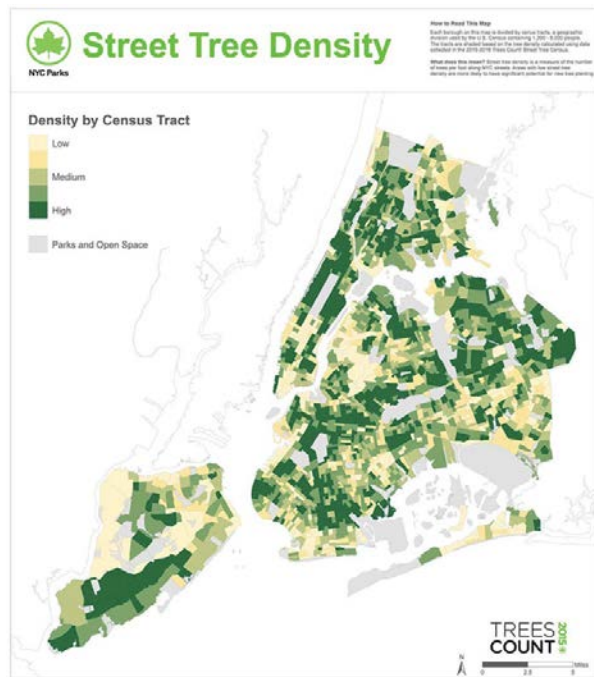

# Strengths of Using Canopy Targets

- Simple and powerful narrative / discourse – attractive to e.g. politicians
- Easy to communicate and understand
- Provides common narrative and sense of direction in complex governance situation
- Measurable indicator of success
- Assemble public support and generate action and involvement
- Highlighting the urgency of loss
- Linked to several key ecosystem services – see the iTree approach
- Allows for benchmarking

# YOU'RE ONE IN A MILLION

We did it! One million trees for New York City!

# MANAGING OUR URBAN FOREST

## LEADING THE REGION IN URBAN FOREST MANAGEMENT

Recognizing the past decades' decline in New Westminster's urban forest canopy the Urban Forest Management Strategy proposes an aspirational canopy target to bring the City in line with the North American average (27%).

Achieving this goal—with a twenty-year time horizon—requires shared vision and coordinated effort between public and private interests.

In the simplest of terms, the expansion of the urban forest is about planting trees... And as a first step, the identification of "plantable spots" across the diverse matrix of urban land uses, identifies existing opportunities to enhance "shrub, herbs and grass" to include urban canopy.

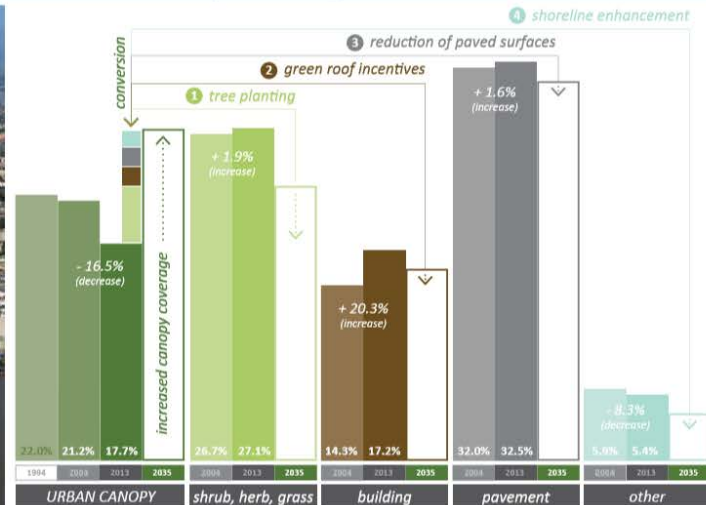

Additional conversion strategies—beyond the planting of trees—are illustrated at right. As New Westminster continues to grow and densify, these strategies will play an increasingly central role in achieving the targets and stated goals of the Urban Forest Management Strategy.

refer to the  
"By the Numbers:  
Canopy Scenarios"  
information board  
for more details

## FOUR CONVERSION STRATEGIES (EXAMPLES) ---> 27% CANOPY TARGET

Strategies beyond tree planting reflect the direct connections between urban forest management and City-wide priorities related to planning and urban design.

## SETTING A TARGET: a goal for urban forest management

## 1. Central governmental agency for the project

- Lateral

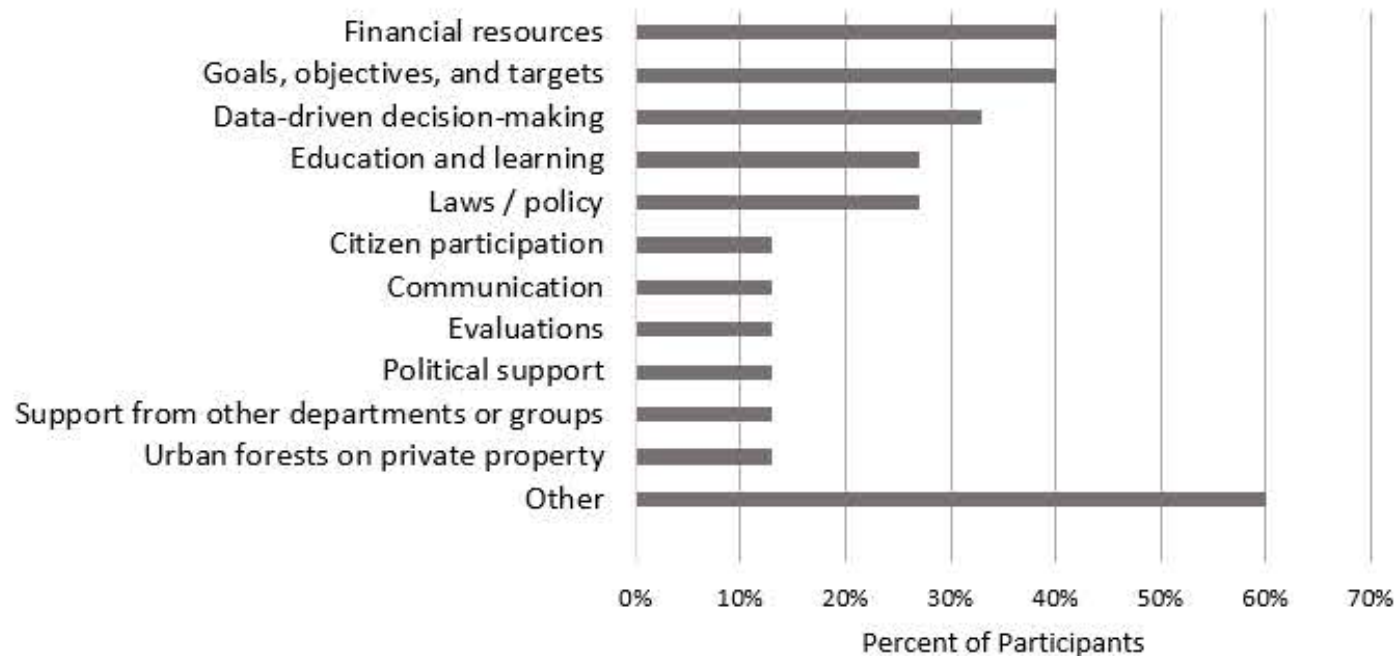

- Forestry and Parks Bureau; (Lead)
- Finance Bureau; (Support)
- Commission of Development and Reform; (Support)
- Commission of Science and Technology; (Support)
- Land and Resources Bureau; (Support)
- Water Authority; (Support)
- Public Security Bureau; (Coordinate)
- Agriculture Bureau; (Coordinate)
- Environmental Protection Bureau; (Coordinate)
- Commission of City planning; (Coordinate)
- Commission of Rural Affairs; (Coordinate)
- Supervision Bureau; (Supervise)
- Audit Bureau; (Supervise)

- Vertical

- Top-down four-layer governmental system

## Factors Prioritized by Participants

*“City-wide tree canopy cover is a useful indicator of the extent of tree presence across a city. Its assessment can be simple, fast and highly reproducibly. Repeat observation could be a cost-effective means of monitoring tree populations, setting targets and tracking effectiveness of planting programmes.”*

# WHEN THINGS BECOME REALLY BAD...

- **Calamities:** an event causing great and often sudden **damage** or **distress**; a disaster
- In urban forestry: a **major loss** of urban forest **canopy** over a **short period of time**

MANAGEMENT

## Trees: the cool approach to city cooling in Phoenix, Arizona

## Singapore: the surprisingly green and biodiverse city

APPLY TODAY >

### STANDARD 1 ESTABLISH RESPONSIBILITY

The city has a written statement by city leaders delegating responsibility for the care of trees within the municipal boundary to a staff member, a city department, or a group of citizens—called a Tree Board.

### STANDARD 2 SET THE RULES

The city has in place a law or an official policy that governs the management of forests and trees. These rules describe how work must be performed—often citing best practices or industry standards for tree care and worker safety—where and when they apply, and penalties for noncompliance.

### STANDARD 3 KNOW WHAT YOU HAVE

The city has an updated inventory or assessment of the local tree resource so that an effective long-term plan for planting, care, and removal of city trees can be established.

### STANDARD 4 ALLOCATE THE RESOURCES

The city has a dedicated annual budget for the routine implementation of the tree management plan.

### STANDARD 5 CELEBRATE ACHIEVEMENTS

The city holds an annual celebration of trees to raise awareness among residents and to acknowledge citizens and staff members who carry out the city tree programme.

WHO guideline:  
9 m<sup>2</sup> of green space / inhabitant

Venus Teo

2.75 · LASALLE College of the Arts

I see many studies citing WHO for their international minimum standard for green space (9m<sup>2</sup> per capita). But where is the actual study?

Question Asked August 21, 2017

I've spent days looking for it but it seems like the actual study does not exist? What is this number based on?

Dear Francisco, there is a recent publication from the WHO which discussed various indicators of green spaces. The primary indicator recommended by the WHO is an accessibility index: a green space (0.5 ha, or 1.0 ha) within 300-m distance. You can check out the publication.

# Pitfalls when Using Canopy Targets

- Cities and local conditions are very different
- Mostly suitable for some ecosystem services (see e.g. i-Tree)
- Public – private; access
- Quite two-dimensional – how about the ‘on the ground’ experience?
- Quantity over quality – resilience, diversity, functionality
- It’s not only about trees
- Issue of uneven distribution of canopy
- Methodology

Dr Greg McPherson: “Targets are best developed for specific cities and should consider **constraints to creating canopy** such as:

- **Development densities** (i.e., dense development patterns with more impervious surfaces have less opportunity for cover);
- **Land use patterns** (i.e., residential areas may have more opportunity for canopy than commercial areas, but canopy cover tends to be less in residential areas of disadvantaged communities versus wealthy ones);
- **Ordinances** (i.e., parking lot shade ordinances promote cover over some impervious areas); and
- **Climate** (i.e., canopy cover in desert cities is often less than tropical cities).”

## Highlights

- Toronto, Canada is a polarized city from the perspective of income.
- Categorical differences in tree canopy related to household income classes.
- Moderate correlation between tree canopy and household income.
- Significant spatial clusters of high/low tree canopy and household income.
- Distributional inequalities present and related to urban forest access.

# PERSPECTIVE

- Canopy targets can be of value – if used with care and together with other criteria and indicators
- Opportunities with technological and research advancement
- What does a specific canopy target represent?
- Linking to the full set of ecosystem services and benefits
- Importance of urban forest legacies
